No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C The present cDNA sequence codes for a claimed single-chain antibody e23

C designated e23(FY), which binds to erib-2. Monoclonal antibody e23

C was generated by immunising mice with N/erbb-2 cells overexpressing the gpl85 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-erbb-2 monoclonal antibody was isolated and converted to cDNA. Regions coding for the heavy- and light- chain variable regions were then amplified by PCR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro diagnosis of tumour cells which overexpress the erbb-2 gpl85 marker, e.g. breast, ovarian and non-small cell lung carcinomas, and, when coupled to a cytotoxic agent, to treat such tumours. The source of human erbB-2 protein for the prodn. of antibodies no The source of human erbB-2 protein for the prodn. of antibodies no 23 and 21 (055180/R45442; 055181/R45443) is a NIH/3T3 cell engineered to express the human erbB-2 protein on its surface (N/erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. I animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

intracellular antiboo
Inhibition of proliferation or survival of, esp. malignant erbB2, cells - by introducing nucleic acid mol. encoding antibody homology which is expressed and binds, pref. erbB2, protein intracellularly claim 42; Page 29-30; 48pp; English.

A nucleic acid comprises a first sequence encoding a signal peptide (R94019) linked to a second sequence (T17728) encoding a signal peptide chain Fv fragment (R94020) that binds a human erbB2 oncoprotein. The anti-erbB2 sFv portion is obtained by PCR using e23scFv

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                plasmid as template. The signal peptide directs the scFv to the endoplasmic reticulum. The nucleic acid is incorporated into a plasmid or viral vector to facilitate expression of the scFv antibor homologue within e.g. an epithelial carcinoma cell. Intracellular expression of the homologue inhibits surface expression of erbB2 are thereby inhibits cell proliferation and cell survival and decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tumorigenicity.

MAD capable of binding to the gamma chain of the IL-2 recept thus of blocking the IL-2 response, is produced by mouse byt line Gp-2 (FERM BP-4641). DNA encoding the variable region this MAD was expressed in E. coli, yielding Fv(GP-2) with immumosuppressive activity.

Example; Fig 8; 37pp; English.

The source of human erbB-2 protein for the prodn. of antibodies not and 21 (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell engineered to express the human erbB-2 protein on its surface (N/erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. animals given a combination of the 2 Abs, tumours completely regressed after 11 days.
